LUMINART  
LIGHTING  
EQUIPMENT

**Art Craft Fixture Co.**

322-328 ADAMS STREET  
NEWARK, N. J.

# MAGI

“THE MAGIC LAMP”

*Patent Pending*

**A**LADDIN, a youth in the “Arabian Nights” becomes possessed of a magic lamp and ring, on rubbing which two genii appear, who are the slaves of the lamp and ring respectively, and who execute the bidding of anyone who may have these in his keeping.

## *A New Field for Lighting Equipment Industry*

Every home that has electric current is a prospective customer.

With Luminart Products and the present lighting equipment, the purchaser may have two methods of lighting the home.

A flood of light from the ceiling fixture now in use, or the soft mellow light of the candle flame with its shadow effects that create an atmosphere of indescribable charm.

Fifteen Luminart bulbs — some located on mantle shelf with appropriate Candle holders; Sconces hung in corners or on the door casings; Lanterns suspended from upper casings of doorways between portieres; the Magi lamp on the bookcase or radio cabinet, lend an effect of artistic beauty rarely, if ever before, witnessed in the modern American home.

## Real Flame Effect

ACTUAL SIZE

PATENTS PENDING

No. F-767

**L**UMINART 6 volt bulb has the smallest lamp base ever produced, about the size of a candle wick.

Operated at full capacity, brilliancy is slightly over one candle power. Life of bulb is 500 burning hours or more. Cost of operation, about one cent for five hours including cost of bulb. A number of these bulbs on test burned constantly for more than 2000 hours.

Can be operated on 110 volt lighting circuit by using properly tested resistance wire, or a Luminart Transformer. *The best results are obtained when transformer is used* (see page 6).

A most economical night light. When used with Transformer will illuminate Hall, Stair-landing, Nursery, etc., from dusk to dawn for a current cost of approximately ONE CENT.

From the artistic viewpoint, its decorative features, when placed in appropriate settings, are greatly admired.

These bulbs are guaranteed against mechanical defects.

# *Luminart Candles*

Are real wax candles made from the same materials as many high grade wick candles. They will not bend or melt unless subjected to unusual heat.

If properly cared for the Luminart candle will last indefinitely. It may be used at the first event and also at the 50th anniversary of that first event.

One of the most practical and useful novelties offered today. No two alike; they are hand dripped.

## *Straight Candles*

All candles have standard candelabra screw base at bottom and special socket at top into which No. F-767 bulb may be screwed.

# Luminart Transformer

No. F-811  
 $\frac{1}{2}$  Actual Size

15 Watt Luminart Transformer  
 For 110 to 120 Volts Alternating Current Only

This transformer is especially designed to be used with Luminart Bulbs and Candles. It has a thermostatic heat control which automatically shuts off the current if heat should reach 165 degrees, due to a short circuit anywhere along line of wiring. This device makes your investment a permanent one as the transformer and wiring circuit are fully protected.

The capacity of 15 watts will allow 15 Luminart lamps to burn at one time at a power consumption cost of about one cent for five hours.

Not more than fifty feet of No. 14 wire should be used with each transformer. It is best to place the transformer as near centre of circuit as possible; instead of running a fifty foot length one way, we suggest running two twenty-five foot lengths from the same connecting posts in opposite directions.

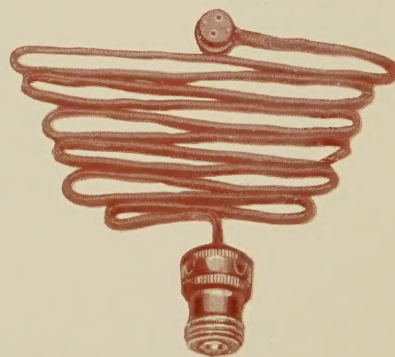

If wire is run under flooring use regular No. 14 rubber covered wire.

# Luminart Resistance Unit

No. F-838 Resistance Unit may be used for *single light* candlesticks. It is especially made conductor which reduces the current from 110 volts to 6 volts, the capacity of a single Luminart bulb. Each length is tested at our factory and must not be shortened. When shortened the resistance to the current flow is lessened and permits too much current to enter the bulb, which is a cause for quickly burning out. With the proper length, however, the life of the bulb will average 500 hours or more.

The power consumption of this unit is about 15 watts, one watt consumed by the bulb and 14 watts dissipated through the wire in the form of heat. These units may be operated on either alternating or direct current.

The cost of operating one bulb by this method is equal to operating 15 bulbs when transformer No. F-811 is used. We, therefore, recommend use of transformer if you have alternating current.

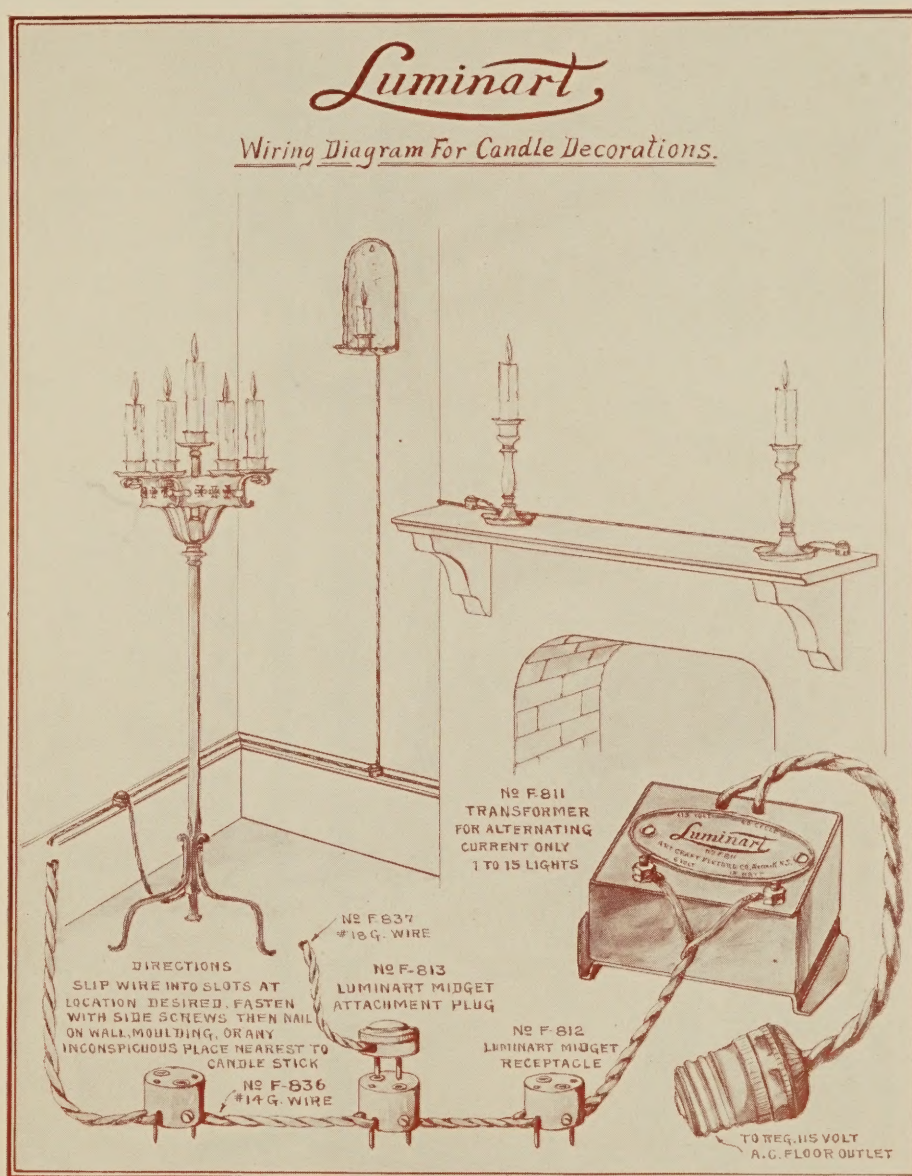

No. F-838

# As Simple As Wiring a Christmas Tree

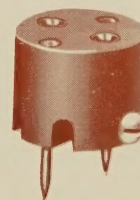

The main circuit from the Transformer to all receptacles No. F-812 should be No. 14 gauge conductor No. F-836. It is made to our specifications, small in size and hardly noticeable when placed along mouldings, base board, door casings, etc. It is possible for anyone when using these materials to have tiny receptacles No. F-812, placed wherever they choose, to have a Luminart Bulb lighted, for decorative or illuminating purposes.

If you desire to have a pair of candlesticks lighted on your mantle shelf, just run No. F-836 wire from the two terminals on the transformer, along the mouldings, attach two No. F-812 midget receptacles and you may have the current conveniently located for your purpose and the source from which the current emanates is rarely in view. In nearly every installation the transformer may be concealed behind a piece of furniture.

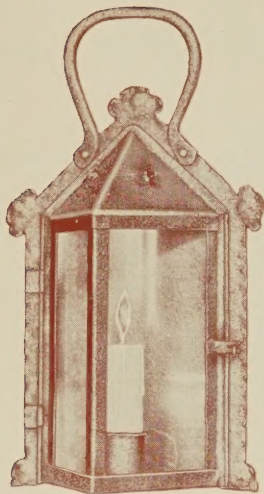

**F-813**  
Attachment Plug  
5/8" Diameter

Among the illustrations following will be found several showing units having more than one candle marked, "wired for transformer circuit." These units are intended for use only where a transformer circuit (alternating current) is provided and will not operate with resistance units.

Christmas wreaths illuminated with the Luminart real wax candles and bulbs are most realistic.

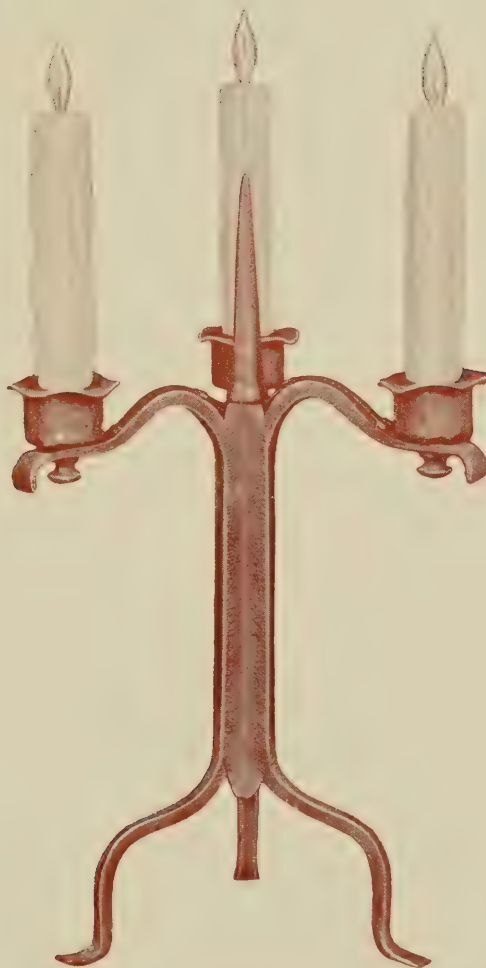

In addition to its attractiveness the economic feature is something to be considered. When operating from No. F-811 transformer, you may burn fifteen bulbs at one time for a current cost of one cent for five hours or three bulbs for 15 hours for one cent. The bulbs if properly cared for will last for several holiday seasons before renewals are necessary.

Metal Candle  
9½" Long  
4 Eveready Batteries  
Ivory finish

The No. 70541 is a metal candle finished to imitate a wax candle and is intended for use in pageants or church processions. It contains four No. 935 Eveready dry cells.

The candle itself will last a lifetime.

The bulb will average 500 hours of life or more.

The life of the batteries is the same as any good flashlight dry cells.

These candles may be carried by children without the fear of fire hazard, a feature which is extremely important.

A pair of candlesticks on the mantle shelf recalls the time when early in the history of our country this luxury was only enjoyed by the wealthy citizen of the Colonies bordering the Atlantic seaboard.

It was the duty of one of the slaves to keep the candle holders free from grease and to polish them by hand periodically. This laborious work is now eliminated by using Luminart candles which do not melt unless subjected to unusual heat and the finished metal is prevented from tarnishing by a covering of transparent lacquer.

To clean them use a soft dry cloth.

# Equipment For Wiring Candle Sticks

No. F-787—No Plug  
No. F-787A—With Plug

Full Size

Just draw wire through hole in your candle stick, connect plug and your stick is then completely wired for Luminart candle and bulb. You must use, however, either F-811 Transformer or F-838 Resistance Unit to reduce voltage to capacity of bulb. See pages 4 and 6.

No. F-836—No. 14 Gauge

Used for wiring to receptacles No. F-812.  
Colors—Brown or Pearl.

No. F-837—No. 20 Gauge

Used for wiring candle sticks.  
Colors—Brown or Pearl.

F-767  
See Page 4

Candles are shown  
on Page 5
